

## Central Systems:

What they are & how they work: *(Literature provided by Bryant.com)*

A central heating and cooling system produces warm or cool air in one central area and then distributes it throughout the home. There are many types of systems that work as central systems, from traditional split systems to packaged product systems.

Products typically used in central heating and cooling systems include:

- Heat Pumps
- Air Conditioners
- Gas and Oil Furnaces
- Fan Coils
- Evaporator Coils
- Controls and Thermostats
