

Self Preventive Maintenance:

What you can do on your own to prevent future problems

Regular maintenance on your heating & cooling system plays a vital role in the over all life expectancy & operating efficiency of your equipment. Below are a few things you can do yourself to help lengthen the life of your equipment & ultimately save money on your energy bills:

- Keep debris & leaves away from your air conditioning unit.
- Keep the air filter in your fan coil or furnace clean by checking & cleaning it every 3-4 weeks. *Safety Tip: Be sure to remove all electrical power before removing any access panels*
- Check to see if the placement of your outdoor unit is on a level surface.
- Clean your humidifier at the beginning of each heating season.

In addition to this self maintenance, your system requires many other maintenance tasks in order to operate efficiently. These specific tasks can only be done by a heating and cooling professional.
